

Algorithmic Trading in Practice (introduction to RTS Tango)

While 'closed' trading tools provided by software developers allow a trader to implement a wide range of strategies, the trader is not able to improve the strategies beyond adjusting the input parameters. Open trading tools provide a platform on which the trader writes his own strategy, offering optimal flexibility. As the language resembles VBA, it is relatively accessible to those who are interested to translate their trading ideas into a coded strategy.

Contents of the course are as follows:

General Introduction into Tango

- System layout and functionality

Literature

- RTS Tango Manual
- TPE scripting syllabus

All courses will include the use of professional trading and analysis software. The hands-on training environment will allow the participant to experience a real-time trading environment on our virtual exchange. This enables the inclusion of Trading Games (either click trading, position management or running your own algorithm) into the course curriculum.
